Estrogens, and antiestrogens to a lesser extent, as well as protein kinase activators and growth factors increase phosphorylation of the ER and/or proteins involved in the ER-specific response pathway.

These new observations led scientists to carefully reevaluate the effects of estrogens (or antiestrogens) on the male reproductive tissues. In that respect, it has been shown that in vitro the multiplication of rat gonocytes is in part regulated by estradiol, which fits well with the presence of ER- $\beta$  in these cells ( 12 ).

Antiestrogens, also known as estrogen antagonists or estrogen blockers, are a class of drugs which prevent estrogens like estradiol from mediating their biological effects in the body. They act by blocking the estrogen receptor (ER) and/or inhibiting or suppressing estrogen production.

A. Estrogen Induction of Genes in the Brain. Estrogens are necessary for the induction of the primary female-typical sexual behavior lordosis in several species. Estrogens regulate the expression of several genes in the brain, some of which are responsible for the facilitation of lordosis (reviewed in Ref. 145). For example, the nonapeptide oxytocin (OT) and its receptor, the oxytocin receptor ...

There exist three primary Estrogens in females: Estrone (E1), Estradiol (E2), and Estriol (E3). All three of these Estrogens are naturally occurring in females, and are steroidal in nature. However, there are some synthetic Estrogens that are non-steroidal as well. Each of the three primary Estrogens serve different roles in female physiology.
